

TOP DESIGN

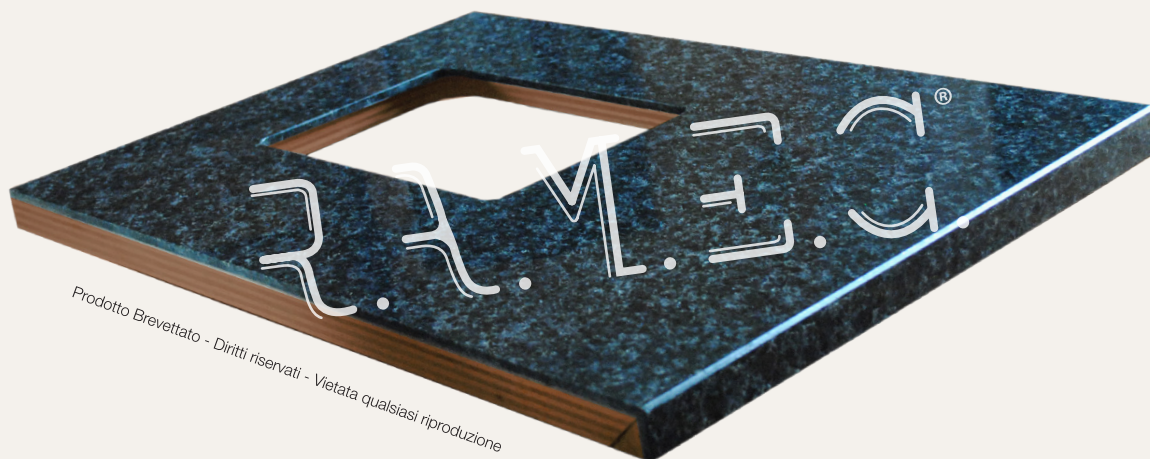

Top Design, evolution of Woodstone product, is born by the patented coupling between an Okoumè multilayer panel, RINA certificate, and a thin slab of marble, granite or any natural stone of only 6 mm in thickness, obtaining so a lightweight product but with high compressive strength.

The development of this product was concentrated in finding a solution that would be able to realize elegant furniture, whose strength was the lightness accompanied by aesthetics. Thanks to the renowned technology developed in the stone industry and especially thanks to the invention of a new glue with no VOC emissions, which allows to glue together different materials, it was possible to create Top Design, which finds its ideal placement in kitchens or bathrooms where the need to decrease the weight load is greater. In fact, with a thickness of 1,6 cm

it has a weight of only 16 kg /sqm, instead of 60 kg/sqm as normally in a top of 2 cm thick, or 90 kg/sqm as in a 3 cm thick ones. Therefore Top Design may be carried and installed into any environment in a easy and practical way. The holes for sinks, or other accessories, can be made both on top and under top thanks to the presence of the Okoumè panel, which gives the product a high mechanical static quality. The solution found in using a multilayer panel, instead of a honeycomb panel or other materials, was dictated by the need both to reduce the costs arising from the well-known application, and to eliminate the mould growth inside the alveolus.

Top Design is also versatile because the total thickness can however vary according to the needs of the designer.
