

# THERMAL DOORS

Doors have the greatest source of heat loss for a home, both those in direct contact with the outside and those inside. The fundamental element to take into account is therefore their thermal transmittance. The solution “insulated door” was therefore designed by us not only to create a distinctive element of elegance, but above all to respond and remedy this important problem.

The thermal insulation values of the doors depend on the materials used for their construction, which is why the new **THERMIKSTONE**® line makes part of the door thermally insulated born from the coupling of marble lightened of only 3/5 mm with natural insulation from 3 mm.

According to the design requirements, exclusive combinations can be made between materials of different nature and origin, combining natural, precious or semi-precious stones, other products such as leather, metal or wood, creating a strong and refined style.

The design proposed in our thermal doors enhances the quality of the materials and the technical solutions adopted. Choosing this product means knowing the beauty and intrinsic value of all its components, breathing modernity, style and refinement in a custom-made that will remain unique.

This product is therefore a perfect combination of aesthetics and energy savings.
